

(a) Steady wedge:  $\chi = 0.5$  isochlor (nonlinear)  
interface rotates about mid-depth as  $\alpha$  grows

(b) First-order velocity  $U_1$   
thick:  $\eta = 0.46$ ; thin:  $\eta = 0.06$

(c) Depth-integrated  $U_1$  is constant in  $\xi$   
(basis of  $\mu_1 = \zeta \text{Pe}/4$ )
